# OUR STORY

# THIS IS US

Chilli Pro Scooter stands for absolute passion and 100% support for the stunt scooter sport. Founded in 2010, with the goal of developing a high-end stunt scooter line-up for all ages and skill levels, we now offer everything from kids' stunt scooters to professional models. According our motto «scooters from riders for riders» we research, develop, test and design day in, day out in cooperation with our Chilli Pro and Flow riders to build the best stunt scooters for you.

# STUNT SCOOTER DICTIONARY

## STREET SCOOTER

Street scooters are generally **larger, heavier and have a wider deck**. They are particularly suitable for riders who are often on the road and **grind on ledges or rails**.

The long, wide deck offers more stability and space for the feet and the rectangular shape allows easier 50-50's and other street tricks.

VS

## PARK SCOOTER

Park scooters on the other hand have a **compact, lightweight deck** and a **shorter T-bar**. They are better suited for more complicated tricks in parks such as combinations of **whips and barspins or briflips**.

7

**CRMO T-BAR**

The chrome-molybdenum alloy is ideal for every rider level. This alloy is characterised by a very **high stability**.

**STEEL T-BAR**

For most riders, the steel bar is the best choice. It is very **robust, durable** and can even **withstand bad landings**.

**ALUMINIUM T-BAR**

The aluminium bar is very **light** and is therefore often used for children's scooters. Taller Riders should only use this T-bar if they have the necessary experience, as this bar can break during a bad landing.

## 100 MM vs 110 MM vs 120 MM WHEELS

Wheels with a diameter of 100 mm, 110 mm or 120 mm are usually used in stunt scooters. The **width is always 24 mm**, so that the wheels fit into all common forks. **The bigger** the wheels are, **the faster** they are, but this also affects the weight.

**Important:** The suitable wheel size depends on the fork and brake used, **not all wheels fit on all scooters.**

## ABEC 7 vs ABEC 9 BEARINGS

Ball bearings ensure that the wheels rotate smoothly. The running speed of ball bearings is given in ABEC. **The higher the number behind the unit, the higher the quality and faster the ball bearing.** For stunt scooters, a distinction is usually made between ABEC 7 and ABEC 9 ball bearings. Cheap stunt scooters often have only ABEC 5.

As a **premium brand**, Chilli uses **only ABEC 9** in all **stunt scooters** to ensure optimal riding characteristics.

## CHILLI COMPRESSION SYSTEMS

Chilli Scooters are equipped with either an **SCS or HIC compression system**. Compression systems connect the bar to the fork and deck. Stunt scooters use special compression systems to **withstand the high loads**. In addition, compression systems **minimize bar wobble** and thus enable easier barspins and tailwhips.

Even if some riders prefer one or the other system, they both **serve the same purpose**. So in the end it is a matter of taste which compression system you choose.

## SCS

With the SCS Compression System (Standard Compression System) the **clamp** is placed on a fork and inside the clamp the screw is tightened from above.

## SPIDER HIC/ HIC

HIC systems (Hidden internal Compression) are almost standard on Chilli Scooters. A HIC shim is placed on a HIC fork and a screw is screwed in from above. The only difference between the classic HIC and a Chilli Spider HIC is that the **shim looks like a spider**, hence its name.
